(54) Title: RECOMBINANT SOLUBLE Fc RECEPTORS

(57) Abstract

Recombinant soluble Fc receptors according to the present invention are characterized by the absence of transmembrane domains, signal peptides and glycosystation. Such Fc receptors can easily be obtained by expressing respective nucleic acids in prokaryotic host cells and treaturation of the obtained inclusion bodies, which procedure leads to a very homogenous and pute product. The products can be used for diagnostic as well as pharmaceutical applications and also for the generation of crystal structure data. Such crystal structure data can be used for the modelling of artificial molecules. A further embodiment comprises coupling the Fc receptors according to the invention to solid materials like chromatoreathym materials that can be used to senarte and/or enrich antibodies.
